Table 2: Average Earnings, National Grantees by State, by Ethnicity ..... 170
Table 3: Average Earnings, National Grantees by State, by Minority Status ..... 175

## Technical Notes on Reading the Tables in Appendices $\boldsymbol{A}$ and $B$

In Appendices A and B of Volume II, grantees are highlighted as having a significantly lower rate of participation for a minority category only if they served less than $80 \%$ of the incidence of that minority category in the population and if the difference is also statistically significant at the .05 level.

The SCSEP percent minority and Census percent minority reported in the second and third columns of the tables in Appendices A and B carry more decimal places than are displayed in the tables. As a result, the percent differences in the fourth column of those tables are often slightly different from the results that would be obtained by using the numbers displayed in the second and third columns without the hidden decimal places.

Because the Census does not report estimates for very small cell sizes, the Census percent minority column can have a value of $0.00 \%$ where the population estimate is either very small (less than $0.5 \%$ ) or actually zero. In either case, the last four columns in the table will all show N/A.

The percent difference can have a value of $0 \%$ when SCSEP serves none of the relevant minority population or only a very small fraction of a percent of the population (less than $0.5 \%$ ). Where this occurs, the column for $<80 \%$ will show $0.0 \%$, the column for significance will show the result of the significance test, and the last column will show 0 or 1 .

Given the very small population estimates for some minority groups, especially American Indians and Pacific Islanders, it is possible that a small Census estimate can still yield statistical significance. Although the associated participation rates may meet both criteria (less than $80 \%$ served and statistically significant), these instances do not meet the test of practical significance that the $80 \%$ rule was meant to determine. Therefore, if the population estimate for a minority category is less than $1 \%$, and there are fewer than 200 individuals in that minority category in the population, the last four columns will show N/A, indicating that no significantly lower rate of participation in SCSEP can be established.

For national grantees by state in Appendix B, the total row in each table shows the aggregate grantee data in the first three columns. (These data are the same as the data in the corresponding grantee tables in Appendix A.) The last three columns do not report the aggregate grantee performance. Instead, they display the count of the number of states for that grantee in which the Percent Difference is less than $80 \%$, the difference is statistically significant, and both tests - less than $80 \%$ and statistical significance - have been met. The same is true for the nationwide, national grantees, and state grantees summary rows in the tables in Appendix A: The last three columns report the number of grantees in which the Percent Difference is less than $80 \%$, the difference is statistically significant, and both tests - less than $80 \%$ and statistical significance have been met.

For more information about these analyses, see Participation, Data Source and Methodology in Volume I of this report.

## Technical Notes on Reading the Tables in Appendices C-H

There are two different tests of significance for the SCSSEP employment outcome measures: the Fisher's Exact test for percentages and the t-test for means (averages). The Fisher's Exact test is used for the entered employment and employment retention measures. The test is only performed on the positive value, e.g., employed, not the negative value. The $t$-test is used for the average earnings measure. Both tests use the Bonferroni method to adjust for multiple comparisons. Both tests are two-sided tests with significance level p<0.05, meaning there were fewer than 5 chances in 100 that this result would have occurred by chance.

The differences in pairs of percentages or averages are denoted by different subscripts in the individual cells. However, cells in a particular row in a table are highlighted only when the disparity in the numbers indicates that the majority is favored over the minority group. For example, if the White cell has an "a" and the Black cell has a "b," and the percentage for the White cell is larger than that for the Black cell, those two percentages or averages are significantly different and the cells will be highlighted. If White is "a" and Black is "a," then there is no significant difference and there will be no highlighting. Moreover, if the table row has White as "a" and Black as "b," but the Black group's percentage or average is higher than the White group's, the row is not highlighted because the disparity favors the minority group. Cells with no subscripts are not included in the tests. Tests assume equal variances.

In certain instances, there are slight discrepancies between the percentages or averages presented for national and state grantees in Volume I and the same numbers presented in the tables in Volume II. These discrepancies, usually a fraction of a percent or a few dollars (in the case of average earnings) are the result of differences in the calculation methods. In no instance are they substantive.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because its column proportion is equal to zero or one.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because its column proportion is equal to zero or one.
2. This category is not used in comparisons because the sum of case weights is less than two.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because its column proportion is equal to zero or one.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because its column proportion is equal to zero or one.
2. This category is not used in comparisons because the sum of case weights is less than two.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because its column proportion is equal to zero or one
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because its column proportion is equal to zero or one.
2. This category is not used in comparisons because the sum of case weights is less than two.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

## Appendix E: Average Earnings Tables, Grantees

Table 1: Average Earnings, by Race

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality
for column means. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3,4}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because there are no other valid categories to compare
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
4. Pairwise comparisons are not performed for some subtables because of numerical problems.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column means. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3,4}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because there are no other valid categories to compare
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
4. Pairwise comparisons are not performed for some subtables because of numerical problems.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality
for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because its column proportion is equal to zero or one.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because its column proportion is equal to zero or one.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at p<.05 in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because its column proportion is equal to zero or one.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because the sum of case weights is less than two.
2. This category is not used in comparisons because its column proportion is equal to zero or one.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Table 2: Employment Retention, National Grantees by State, by Ethnicity

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because its column proportion is equal to zero or one.
2. This category is not used in comparisons because the sum of case weights is less than two.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Table 3: Employment Retention, National Grantees by State, by Minority Status

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column proportions. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3}$

1. This category is not used in comparisons because its column proportion is equal to zero or one.
2. This category is not used in comparisons because the sum of case weights is less than two.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Note: Values in the same row and subtable not sharing the same subscript are significantly different at $\mathrm{p}<.05$ in the two-sided test of equality for column means. Cells with no subscript are not included in the test. Tests assume equal variances. ${ }^{3,4}$

1. This category is not used in comparisons because there are no other valid categories to compare
2. This category is not used in comparisons because the sum of case weights is less than two.
3. Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
4. Pairwise comparisons are not performed for some subtables because of numerical problems.

[^0]:    ${ }^{1}$ Highlighting indicates grantees that served less than $80 \%$ of a minority category where the difference was also significant at the .05 level.
